

Wealth 2050 – part three

Global Issues and Future Industries

In the third instalment of our Wealth 2050 series, we look at some of the global concerns that we're currently faced with and how these could potentially be resolved.

The world is moving at a pace never before experienced.

As such, we're being faced with unprecedented challenges

from a large, ageing population and a climate emergency,

to record government spending and high inflation.

So, what is being done to tackle these issues?

And which sectors and industries are set to benefit as a result?

Mother nature is yearning for help

and technology and digital transformation will remain at the heart of almost all renewables and recycling solutions.

Healthcare budgets continue to be challenged

but this could be greatly aided by AI, which supports improvements in care outcomes, patient experience and overall access to services.

Similarly, automation is undergoing a wave of innovation spurred by advances in this field, meaning that machines can complement human labour.

Big investments in infrastructure are likely to boost activity for several years

and extend the economic cycle, lifting productivity and profitability across the globe.

In response to the pandemic, supply chain bottlenecks and the energy crunch, Asian countries stepped up to remake their economies to be more sustainable, quality-focused and resilient

making it a region with much potential.

We believe that we are at the start of the Big Reset.
